Where can i send my waste?
Waste Classification & WAC

**accuWaste**
accurate waste classification

The first step to classifying your waste is to undertake a WM3 waste classification. This involves solid sample analysis for reasonably expected contaminants, although typically this will comprise a minimum of pH, heavy metals, PAH, TPH and asbestos presence/absence. This analysis can inform you whether your waste is hazardous or non-hazardous. Only once this step has been undertaken may WAC analysis be required, dependent on your desired disposal option.

accuWaste can assist you in every step of the waste classification process.

Solid Sample Analysis
Test for contaminants that are reasonably expected to be present within the waste

Is your waste hazardous?

NO → **Is waste likely to be inert?**

YES → **Send to lab for WAC testing**

Does sample exceed thresholds for hazardous disposal?

YES* / NO

Send to lab for WAC testing

Was sample inside thresholds for inert disposal?

YES / NO

NO / YES

Material requires further treatment prior to landfill disposal

Send to INERT landfill

Send to NON-HAZARDOUS landfill

Send to HAZARDOUS landfill
